

Permanently Stabilize Your Foundation Walls

PN #MBPBH

POWERBRACE™ SYSTEM

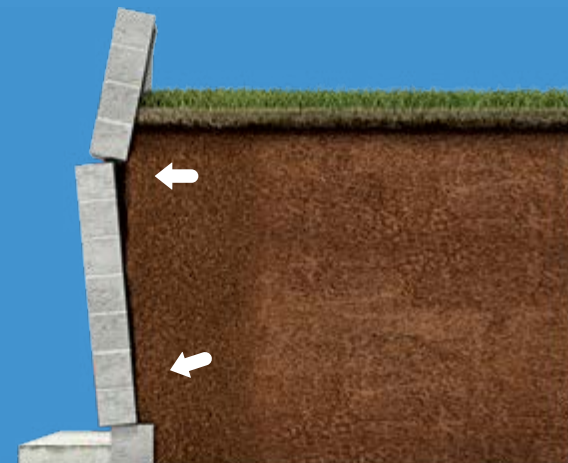

Happy Homes Demand Real Support.

YOUR HOME IS PRECIOUS. It's where you grow your family, welcome friends, and create lasting memories. Nothing should stand in the way of that. As your basement walls begin to crack, bow, and lean inward, the very foundation from which your life is built becomes compromised. Finding a permanent solution that addresses the true cause of your foundation problem is the surest way for you to get on with your life's happenings and enjoy peace of mind.

How did your walls get this way?

As forces of nature, such as moisture and frost, interact with the soil around your home, the soil expands. That expansion results in constant inward force on your foundation wall until it can no longer support the pressure, causing cracking, bowing, and tipping.

The Proven Solution

THE PATENTED POWERBRACE™ SYSTEM exclusively from Foundation Supportworks, Inc. permanently stabilizes your home's foundation walls. Zinc-plated steel beams are custom-fit to your basement wall height and secured tight against your basement wall with brackets anchored to your basement floor and floor joists.

PowerBrace's unique, patented design allows the system to be tightened over time, potentially reversing wall failure without any invasive drilling or digging on the property.

PowerBrace Systems are installed year-round, often in less than one day. Restore your property value and enjoy peace of mind right away.

Our Promise, Your Property

Rest assured that the PowerBrace System will immediately stabilize your foundation walls and permanently protect them against any further movement. The PowerBrace solution comes with a 25-year warranty against manufacturing defects and a performance warranty from your local dealer.

ADVANTAGES

No heavy equipment needed for installation

No disturbance to lawn and landscaping

Zinc-plated system looks great and will not rust

Can straighten walls over time

INSTALLATION

1

Top of PowerBrace beam is secured to the floor joists

2

Beam is secured and plumbed

3

Bottom of beam is anchored to the floor

4

System can be tightened to straighten wall over time
